

SAP Configuration Agent

Setup Guide

Installation & First-Time Configuration

Version 1.0 · September 2026

1. Overview

SAP Configuration Agent is a desktop tool that automates the download and preparation of configuration templates from SAP S/4HANA Cloud Public Edition. Consultants use it to manage Implementation Activities, connect to live SAP systems, and generate pre-filled Excel templates for PATH 1 and PATH 2 configuration activities.

This guide covers installation and first-time setup. Once set up, consultants simply double-click a shortcut to launch the tool.

2. Prerequisites

Please ensure the following are installed before running the setup script.

2.1 Python 3.11 or Newer

Download from: <https://www.python.org/downloads/>

IMPORTANT During Python installation, tick the checkbox "Add Python to PATH". If this is missed, the setup script will not be able to find Python and will fail.

2.2 Google Chrome or Microsoft Edge

Either browser is supported. The tool launches your installed browser (not a hidden window) so you can log into SAP using your normal SSO/IDP credentials. Download Chrome from: <https://www.google.com/chrome/>

2.3 Internet Access (setup only)

The setup script downloads Python packages from PyPI. Internet access is required during setup. Once set up, the tool runs fully offline.

3. Installation

3.1 Extract the ZIP file

You will receive a file named SAP-Config-Agent.zip. Extract it to a folder on your local machine.

TIP Recommended location: C:\Users\YourName\SAP Config Agent\ — Do not extract to a OneDrive or network drive, as the browser session files need to be written locally.

3.2 Run the setup script

1. Open the extracted folder

You should see the following files:

```
Setup - Run First Time.bat ← double-click this
Start SAP Config Agent.bat
README.txt
backend\    brain_store\
```

2. Double-click "Setup - Run First Time.bat"

A terminal window opens. The script installs Python packages and the Playwright browser engine. This takes approximately 2–3 minutes.

NOTE You may see a Windows Defender SmartScreen warning. Click "More info" then "Run anyway". The file is safe — it is just a batch script that calls pip install.

3. Wait for the confirmation message

When setup completes successfully, the terminal shows: "Setup complete! Run Start SAP Config Agent.bat to begin." Press any key to close the window.

ERROR? If you see "Python is not installed", close the terminal, install Python 3.11+ (tick "Add to PATH"), then run the setup script again.

4. Starting the Application

After setup is complete, you do not need to run the setup script again. Every day, simply:

1. Double-click "Start SAP Config Agent.bat"

The script starts the backend server and automatically opens your browser to <http://127.0.0.1:8000>

2. Wait a few seconds

The tool loads the activity brain (4,000+ SAP activities). You will see the Projects dashboard appear in your browser.

3. Keep the terminal window open

The terminal window titled "SAP Config Agent Server" must remain open while using the tool. Close it to stop the server.

5. Verifying a Successful Installation

When the tool is running correctly, the browser shows the Projects dashboard with four statistics at the top:

- Total Activities — should show 4,233
- PATH 1 — should show 1,306
- PATH 2 — should show 2,927
- Scope IDs — should show 774

If the statistics show "—" (a dash), the backend has not finished loading. Wait 10–15 seconds and refresh the page (F5).

6. Troubleshooting

Problem	Solution
"Python is not installed"	Install Python 3.11+ from python.org . Tick "Add Python to PATH" during install, then run the setup script again.
"Failed to load projects. Is the backend running?"	The backend has not started yet. Wait 15 seconds and do a hard refresh (Ctrl+Shift+R). If this persists, close and reopen Start SAP Config Agent.bat.
Statistics show "—" on the dashboard	The brain is still loading. Wait 15 seconds and refresh (F5).
Browser does not open automatically	Open your browser manually and go to http://127.0.0.1:8000
"Chrome not found" when connecting to SAP	Install Google Chrome or Microsoft Edge. Alternatively, set the environment variable CHROME_PATH to your browser executable path.
Setup script fails with a pip error	Check your internet connection and try again. If behind a corporate proxy, ask IT to add python.org and pypi.org to the proxy whitelist.

7. Support

For installation issues, contact your implementation lead or the tool administrator. For SAP-related questions (login, URL, scope IDs), contact your SAP system administrator.
